OPTICAL FIBER AMPLIFIER WITH DISPERSION COMPENSATION FUNCTION

## Abstract:

**PROBLEM TO BE SOLVED:** To obtain a compact low noise optical fiber amplifier with dispersion compensation function, by connecting a rare earth doped optical fiber with which a chirp fiber grating is connected, with the second port of a 3-port type circulator.

**SOLUTION:** A WDM coupler 5, an erbium doped optical fiber 3 and a 1.55  $\mu\text{m}$  band linear chirp fiber grating 8 are connected in series with the second port of a 3-port type circulator 1. Through the WDM coupler 5, the erbium doped optical fiber 3 is excited by a 1.48  $\mu\text{m}$  band semiconductor laser 6. Thereby inputted optical pulses of 1.55  $\mu\text{m}$  band are amplified and subjected to dispersion compensation. By connecting the long wavelength side of the chirp fiber grating 8 with the erbium doped optical fiber 3, the longer wavelength side light is the more rapidly reflected, so that the optical signal which has propagated in a 1.33  $\mu\text{m}$  zero-dispersion fiber is subjected to dispersion compensation.
